

# Scrum Masters

SafeNet Consulting's staff are available to facilitate efficiency, provide transparency, and help set standards and goals. Scrum masters ensure everyone shares a group understanding and shared responsibility for success.

Scrum masters are essential to agile teams. They perform mission-critical activities from sprint planning and retrospectives to conversations with product owners and stakeholders. These steps allow for clear direction and focus for organizing, leading, and removing impediments for the development team.

## How We Do It

Our Scrum Masters bring years of experience on many different projects and employ an incremental approach to assure predictability and control risk in the software development process. We work together with our product owners and stakeholders to set up clear deliverables while keeping the development team engaged, informed, and delivering consistent results.

### Inspect

We define our initial backlog in user stories to determine the minimum viable product or MVP. Then based on feedback we refine our future work to meet expectations based on the product owners.

### Transparency

Scrum Masters are skilled at providing transparency by setting standards and goals so everyone shares a group understanding and shared responsibility for success.

### Adapt

A scrum team will collectively look at progress and results critically to determine what is working well and what is not. Our scrum masters will help the team by using a critical mindset to continue to refine and improve processes.

We strive to improve efficiencies and facilitate Scrum processes for better creativity and better performing teams. A scrum master delivers quality software solutions on time and on budget.
